

API Performance MCP Server - Execution Report

Project: ApiPerformanceMcpServer | Runtime: .NET 9 | Transport: MCP stdio | Report date: May 20, 2026

Executive Summary

The MCP server was built and verified successfully. It initialized over MCP, exposed the expected tools, and executed live API performance tests using the configured sample endpoints.

0 Build warnings and errors	2 MCP tools discovered	115.26 ms Latency advantage for httpbin
--------------------------------	---------------------------	--

Build And MCP Verification

Recommendation

Use <https://httpbin.org/get> for lower average latency. It was faster by 115.26 ms and had fewer failures.

Execution Charts

Observations

- 1. The MCP server exposed both required tools and returned structured JSON output.
- 2. httpbin.org/get completed both comparison iterations successfully and had the lower average latency.
- 3. jsonplaceholder.typicode.com/posts recorded one SSL connection failure during the comparison run.
- 4. A larger iteration count is recommended before using these numbers for production decisions.

Note

The comparison run includes a reported SSL error for API 1. This confirms error handling is visible in final output.
